What is Streamer?

Streamer downloads music from Qobuz in the quality you choose — from MP3 all the way up to 24-bit/192 kHz Hi-Res FLAC. It comes in two flavors:

- **GUI** (graphical app) — search, browse, and download with clicks. Requires Windows 10+ with Microsoft Edge installed.

- **CLI** (command line) — scriptable, fast, works in terminals.

Both read the same config file, so credentials set up in one work in the other.

First-Time Setup

Step 1 — Open the App

Double-click `streamer-gui.exe`. The window has three tabs at the top: **Search**, **Downloads**, and **Settings**. Go to **Settings** first.

Step 2 — Create an Account Slot

Click **+ Add**. A new empty row appears in the account list on the left. Click it to select it.

Step 3 — Log In

1. Type your **email** in the Email field (optional, just for display).
2. Click **Login with Qobuz**.
3. A browser window opens inside the app showing the Qobuz login page.
4. Log in with your Qobuz account (email/password, Google, Apple, etc.).
5. The browser closes automatically once login succeeds.
6. You see *"Login successful."* — done!

Tip

The country code (US, FR, etc.) is detected automatically from your account. You do not need to type it.

Step 4 — Set Your Download Folder

Still in Settings:

1. Click **Browse...** next to the Download Dir field.
2. Pick the folder where you want your music saved.
3. Click **Save Settings**.

Step 5 — Pick a Quality

Scroll the Quality wheel to your preferred level:

Level	Format	Typical size (per album)
mp3	320 kbps MP3	~100 MB
flac	16-bit / 44.1 kHz	~300 MB
flac-hi	24-bit / 96 kHz	~1 GB
flac-ultra	24-bit / 192 kHz	~2 GB

Click **Save Settings** when done.

Searching for Music

Go to the **Search** tab.

Basic Search

Type what you want and press **Enter**:

```
daft punk
```

Results appear in a table. Each row shows: Title, Artist, Label, Date, Duration, Genre, Hi-Res, Explicit, Type, and Country.

Filters

You can narrow results by adding `field:value` filters. Use quotes around multi-word values.

Filter	What it does	Example
<code>artist:"..."</code>	Match artist name	<code>artist:"Taylor Swift"</code>
<code>title:"..."</code>	Match title	<code>title:"Anti-Hero"</code>
<code>genre:...</code>	Match genre	<code>genre:jazz</code>
<code>label:...</code>	Match record label	<code>label:republic</code>
<code>type:...</code>	Content type	<code>type:album</code>
<code>country:...</code>	Account country	<code>country:US</code>
<code>year:...</code>	Release year	<code>year:2024</code>
<code>year:...-...</code>	Year range	<code>year:2020-2024</code>
<code>hires:true</code>	Hi-Res only	<code>hires:true</code>
<code>explicit:true</code>	Explicit only	<code>explicit:true</code>
<code>explicit:false</code>	Clean versions only	<code>explicit:false</code>

Combining Filters

Filters are combined with **AND** by default (just put them next to each other). You can also use **OR**, **NOT**, and parentheses:

```
"the life of a showgirl" artist:"taylor swift" explicit:true NOT type:playlist
```

This means: search for "the life of a showgirl", only from Taylor Swift, only explicit versions, and exclude playlists.

More examples:

```
artist:"Pink Floyd" year:1970-1980 hires:true
```

```
(artist:"Daft Punk" OR artist:"Justice") type:album
```

```
genre:classical NOT explicit:true
```

Understanding the Results

Results are **grouped by artist** and sorted newest-first within each group. The columns tell you:

- **Title** — includes the version in parentheses if available, e.g. *Midnights (Deluxe)* vs. *Midnights*.
- **Label** — the record label (helps distinguish pressings).
- **Date** — full release date, not just the year.
- **E** — shows **E** for explicit content.
- **Hi-Res** — shows **Yes** if hi-res audio is available.
- **Country** — which of your accounts found this result.

Downloading

From Search Results

1. Click a row in the search results.
2. Click **Download Selected** (or right-click and choose Download).
3. Switch to the **Downloads** tab to watch progress.

From a URL

Paste a Qobuz link into the **URL bar** at the top and press **Enter**:

```
https://www.qobuz.com/us-en/album/random-access-memories/abcdef123
```

What Gets Downloaded

For each album, Streamer creates:

```
Music/ Artist Name/ Album Title/ 01.flac 02.flac ... cover.jpg  
album_description.txt (if available) booklet.pdf (if available) artist_bio.txt  
(if available) artist.jpg (if available)
```

If you have multiple accounts with different countries, a country subfolder is added: Music/US/Artist/Album

Downloads Tab

The Downloads tab shows:

- A **list** of all queued/active/completed downloads with status and progress percentage.
- A **log area** at the bottom with detailed messages (useful if something goes wrong).
- A **Cancel Selected** button to stop a running download.

Keyboard Shortcuts

Shortcut	Action
Enter	Search (in search box) or Download (in URL bar)
Ctrl+A	Select all text in the current field
Ctrl+Backspace	Delete previous word
Ctrl+Delete	Delete next word
Tab	Move to next field

Multiple Accounts

You can add several Qobuz accounts (e.g. one US, one FR) to access region-specific catalogs.

1. Go to **Settings** and click + **Add** for each account.
2. Log in to each one.
3. When you search, results from *all* accounts are merged. The **Country** column tells you which account found each result.
4. Downloads automatically use the correct account.

You can export/import your accounts with the **Export Accounts** and **Import Accounts** buttons (saves as JSON, useful for backup).

Command Line Usage

For advanced users or scripting, `streamer.exe` can be used directly in a terminal.

Login

```
streamer.exe web-login --email you@example.com --password secret
```

Download an Album

```
streamer.exe download "https://www.qobuz.com/us-en/album/..." --quality flac-hi
```

Or with a bare ID:

```
streamer.exe download abc123def --quality flac
```

Search

```
streamer.exe search "pink floyd" --type albums -n 50
```

Add `--tsv` for machine-readable output (tab-separated).

Change Settings

```
streamer.exe config set-dir "D:\Music" streamer.exe config set-quality flac-  
ultra streamer.exe config show
```

Configuration File

Location: %APPDATA%\streamer\config.toml

You normally don't need to edit it by hand (the GUI and CLI manage it), but it looks like this:

```
[[accounts]]  
country = "US"  
email = "you@example.com"  
app_id = "..."  
app_secret = "..."  
user_id = "12345"  
auth_token = "..."  
  
[settings]  
download_dir = "C:/Users/You/Music"  
quality = "flac"  
concurrency = 4  
requests_per_minute = 0
```

Troubleshooting

Login dialog opens but nothing loads

Make sure Microsoft Edge is installed. The login dialog uses Edge's WebView2 engine.

Download fails with "os error 123"

The download directory path is invalid. Go to Settings, click Browse, pick a valid folder, and Save Settings.

App crashes on login

Check the log file at %APPDATA%\streamer\streamer-gui.log — it records what happened right before the crash.

Search returns no results

Check that at least one account is logged in (Settings tab should show "Authenticated").

Linker error "cannot open file streamer-gui.exe"

The app is still running. Close it first, then rebuild.

Garbled characters in file names

Make sure you built the GUI with the /utf-8 compiler flag (already set in CMakeLists.txt).

Streamer is not affiliated with Qobuz.
A valid Qobuz subscription is required to download music.
