Overview

Streamer downloads music from Qobuz — from 320 kbps MP3 up to 24-bit/192 kHz Hi-Res FLAC. It comes in two forms that share the same config file:

- **streamer-gui.exe** — graphical app for Windows. Search, pick what you want, and download. Works on any Windows 10+ machine.
- **streamer.exe** — command-line tool. Faster, scriptable, and runs anywhere you can open a terminal.

A valid Qobuz subscription is required.

Login — Getting Your Credentials

Qobuz blocks direct email/password login from third-party tools. Streamer instead reads your session token from a browser where you are already logged in, using a small browser script. You only need to do this once (or whenever your token expires, which is rare).

Step 1 — Install the Userscript

1. Install **Violentmonkey** (Firefox, Chrome, Edge) or **Tampermonkey** from your browser's extension store.
2. Drag the file `streamer-login.user.js` (located in the same folder as `streamer-gui.exe`) onto the Violentmonkey dashboard tab, or open it directly in your browser.
3. Click **Install** when the extension asks.

Step 2 — Copy the Login Command

1. Open `https://play.qobuz.com` and log in normally — with your email and password, Google, or Apple. The script runs on that page.
2. A button appears in the bottom-right corner of the page. It starts dimmed while waiting for your session to load:

`[waiting]` Waiting for login...

3. Once the page has loaded your session (a second or two), the button becomes clickable:

`[copy]` Copy streamer login

4. Click it. The script intercepts the authentication token that Qobuz sends with every page request and copies this command to your clipboard:

```
streamer.exe login --user-id "12345678" --token "eyJhb..."
```

Step 3A — Save via the GUI

1. Open `streamer-gui.exe` and go to the **Settings** tab.
2. Click **+ Add** and select the new empty row.
3. From the clipboard command, copy *only the number* after `--user-id` and paste it into the **User ID** field.
4. Copy the long string after `--token` and paste it into the **Token** field.
5. Click **Save Credentials**.

On success the row shows **Authenticated** and your country code (US, FR, etc.) is detected automatically.

Tip

If you have multiple accounts (e.g. one US, one FR), repeat Steps 2–3 for each account and add a separate row for each.

Step 3B — Save via the CLI

Paste the copied command directly into a terminal:

```
streamer.exe login --user-id "12345678" --token "eyJhb..."
```

The tool contacts Qobuz to verify the token, detects your country code, and writes everything to the config file. You should see:

```
Country: US  
Login successful. Config saved.
```

Step 4 — Set Your Download Folder

In the **Settings** tab, click **Browse...** next to *Download Dir*, pick a folder, and click **Save Settings**.
Or from the terminal:

```
streamer.exe config set-dir "D:\Music"
```

Step 5 — Choose a Default Quality

Setting	Format	Approx. size / album
mp3	320 kbps MP3	~100 MB
flac	FLAC 16-bit / 44.1 kHz	~300 MB
flac-hi	FLAC 24-bit / 96 kHz	~1 GB
flac-ultra	FLAC 24-bit / 192 kHz	~2 GB

Scroll the **Quality** wheel in Settings and click **Save Settings**. You can override the quality per download from the CLI with `--quality`.

Searching — GUI

Click the **Search** tab.

How a Search Works

1. Type your query in the search box and press **Enter** (or click **Search**). Streamer fetches up to 50 results per content type per account from Qobuz.
2. Results appear in the table immediately. A counter above the list shows **N / M results**: N is how many pass the current filter, M is the total fetched.
3. **As you keep typing**, the visible results are filtered in real time — without hitting the network again. This lets you quickly narrow a large result set without a new search.

The Type Picker

The scroll wheel on the right side of the search bar selects what kind of content to fetch:

Mode	What it does
Smart (auto)	Detects the type from your query (see below)
Albums	Only album results
Tracks	Only track results
Artists	Only artist results
Playlists	Only playlist results
All types	Fetch all four types at once

Smart (auto) looks for a `type:` filter in your query and uses that as the API type. If no type filter is found, it fetches all types. Example: typing `pink floyd type:album` on Smart mode only fetches albums from the API — faster than fetching everything.

Filter Syntax

Inside the search box you can combine free-text terms with structured filters. Filters have the form `field:value` or, for numeric fields, `field:>value`.

String filters (partial match, case-insensitive)

Filter	Matches	Example
<code>artist:value</code>	Artist name contains value	<code>artist:"pink floyd"</code>
<code>title:value</code>	Title contains value	<code>title:"wish you were"</code>
<code>genre:value</code>	Genre contains value	<code>genre:jazz</code>
<code>label:value</code>	Record label contains value	<code>label:ecm</code>
<code>type:value</code>	Content type	<code>type:album</code>
<code>country:value</code>	Account country	<code>country:US</code>

Numeric filters (year and duration)

`year` is the release year. `duration` is in **seconds**.

Operator	Meaning
year:2024	Exact year
year:2020-2024	Year range (inclusive)
year:>2020	After 2020
year:<=1975	Up to and including 1975
duration:>=600	At least 10 minutes (600 s)
duration:<180	Under 3 minutes
duration:300-600	Between 5 and 10 minutes

Boolean filters

Filter	Meaning
hires:true	Hi-Res audio available
hires:false	Standard resolution only
explicit:true	Explicit content
explicit:false	Clean / censored version

Logical operators

Terms next to each other are AND by default. You can also use:

Operator	Aliases	Example
AND (implicit)	AND, y, &&	pink floyd hires:true
OR	OR, o,	artist:coltrane OR artist:mingus
NOT	NOT, !	jazz NOT explicit:true
Parentheses	()	(artist:coltrane OR artist:mingus) type:album

Spanish aliases

All field names are also accepted in Spanish: artista, título, álbum, género, sello, tipo, país, año, duración, alta_res, explícito.

Boolean values are also accepted in Spanish: sí / verdadero for true, and no / falso for false.

Practical Examples

```
pancrasia type:album duration:>=600
```

Albums matching "pancrasia" with total duration at least 10 minutes.

```
artist:"pink floyd" year:1970-1980 hires:true
```

Hi-Res Pink Floyd albums from the 1970s.

```
(artist:"coltrane" OR artist:"mingus") type:track duration:>480
```

Tracks over 8 minutes by Coltrane or Mingus.

```
género:jazz año:>2020 NOT explícito:sí
```

Clean jazz releases from after 2020.

Reading the Results

Column	Content
Title	Name, with version in parentheses when available
Artist	Primary artist or performer
Label	Record label
Date	Full release date
Duration	Track or album total length (m:ss)
Genre	Genre tag
Hi-Res	Yes if hi-res audio is available
E	Explicit content marker
Type	album / track / artist / playlist
Country	Which of your accounts returned this result

Results are grouped by artist, then sorted newest-first within each artist. When you click a row, a short summary appears in the counter area above the list.

Downloading — GUI

Downloading One Item

Right-click any row and choose **Download**, or click a row to select it and then click **Download Selected** at the bottom right.

Downloading Multiple Items (the Cart)

1. **Tick the checkbox** on the left of each row you want. Checked items appear in a **Selected** list below the results table and stay checked even if you run a new search.
2. The button at the bottom right updates to show how many items are queued: **Download (3)**, for example.
3. Click **Download (N)** to send all queued items to the **Downloads** tab. The cart clears automatically.
4. Click **Clear All** in the Selected section to uncheck everything without downloading.

Tip

The cart survives new searches. You can search for "Coltrane", tick some albums, then search for "Miles Davis", tick more albums, and download all of them at once.

What Gets Saved to Disk

```
Music/  
US/  
Artist Name/  
Album Title/  
01. Track Title.flac  
02. Track Title.flac  
...  
cover.jpg  
album_description.txt (if available)  
booklet.pdf           (if available)  
artist_bio.txt        (if available)  
artist.jpg            (if available)
```

If you have only one account with no country set, the country subfolder (US/) is omitted.

The Downloads Tab

Switch here to watch progress. The top part lists every queued and active download with its current status. The log at the bottom shows detailed messages — check it if something fails.

Searching and Downloading — CLI

Search

```
streamer.exe search "pink floyd" --type albums
```

Available types: albums, tracks, artists, playlists, all. Default is albums.

Limit the number of results (default 20):

```
streamer.exe search "coltrane" --type tracks -n 50
```

Duration Filter

The CLI supports `--min-duration` and `--max-duration`. When either flag is active, the duration is shown in brackets next to each result ([1:08:58]). Accepted formats:

Format	Meaning
600	600 seconds (bare integer)
90s	90 seconds
10m	10 minutes
2h	2 hours
1h30m	1 hour 30 minutes
1:30	1 min 30 s (mm:ss)
1:30:00	1 h 30 min (hh:mm:ss)

```
streamer.exe search "pancrasia" --type albums --min-duration 10m
```

```
streamer.exe search "coltrane" --type tracks --min-duration 8m --max-duration 20m
```

Important

Duration filtering happens after the API responds. Streamer fetches up to 5× the requested limit to compensate, but if very few results in the catalog match your range, you may receive fewer rows than -n asks for. Raise -n if needed.

Add --tsv for tab-separated output (columns: id, title, artist, label, date, **duration in seconds**, genre, hires, type, explicit):

```
streamer.exe search "pancrasia" --type albums --min-duration 10m --tsv
```

Download

By URL:

```
streamer.exe download "https://www.qobuz.com/us-en/album/..." --quality flac-hi
```

By bare ID (album IDs are alphanumeric strings; track IDs are integers):

```
streamer.exe download abc123def
streamer.exe download 12345678 --quality flac
```

Use --account N (0-based) to pick which account to download with. The default is account 0.

Multiple Accounts

You can add as many Qobuz accounts as you like — one per country is common when catalogs differ by region.

- In the GUI: click + **Add** in Settings for each account and log in to each one separately.
- With the CLI: run `login` once per account. Each call creates a new account slot (matched by user ID, so running it again for the same account just refreshes the token).

When you search in the GUI, Streamer queries *every* configured account and merges the results. The **Country** column tells you which account found each row, and the correct account is used automatically when you download.

Use **Export Accounts** / **Import Accounts** in Settings to back up your credentials as a JSON file.

Configuration File

Location: %APPDATA%\streamer\config.toml

```
[[accounts]]
country = "US"           # set automatically on login
email = ""               # optional, display only
app_id = "..."
app_secret = "..."
user_id = "12345678"
auth_token = "..."

[settings]
download_dir = "C:/Users/You/Music"
quality = "flac-ultra"   # mp3 | flac | flac-hi | flac-ultra
concurrency = 8          # parallel download workers
requests_per_minute = 0  # 0 = no limit
```

All fields are managed by the GUI and CLI. You can edit this file by hand if needed, but be careful to keep valid TOML syntax.

Troubleshooting

The script button stays dimmed after the page loads

The script captures tokens from network requests that happen *after* the page starts. If the tab was already open when you installed the script, reload the page (**F5**). Make sure you are signed in to `play.qobuz.com` before clicking.

“Login successful” but the account shows Not logged in in the GUI

The GUI reads the config file on startup. Restart `streamer-gui.exe` after logging in from the CLI, or use the GUI’s own credential fields.

Download fails with “401 Unauthorized” or “Not authenticated”

Your session token has expired. Repeat the login steps (Section 2) to get a fresh token.

Download fails with a path error (“os error 123” on Windows)

The download directory path is invalid or does not exist. Go to Settings, click Browse, pick an existing folder, and Save Settings.

Search returns nothing, or “No account at index 0”

No account is configured. Check the Settings tab: at least one row must show **Authenticated**. If all show “Not logged in”, follow Section 2 to log in again.

Duration filter returns fewer results than requested

Expected — see the warning box in Section 5.2. Increase `-n`.

File names contain garbled characters

This is a build issue: ensure `streamer-gui.exe` was compiled with the `/utf-8` flag (it is set in `CMakeLists.txt` by default). Re-download or rebuild.

Streamer is not affiliated with Qobuz.
A valid Qobuz subscription is required to download music.
